

Your data retention and data security concerns stop here.

Your content is securely stored and can be easily recovered with Lectora Online's advanced underlying architecture and data backup schedule. You can rest assured that all your data remains private and secure.

Data Retention

Your content and data within Lectora Online is backed up nightly to an Amazon S3 (Simple Storage Service) storage unit in an encrypted form. Amazon S3 is widely known as a reliable and secure storage unit.

One of the top forms of data loss is due to human error, but if you accidentally delete or alter your content, it can be easily restored within Lectora Online. Trivantis can recover data at the title level, the user level, or for an entire organization whenever necessary.

Data Security

Lectora Online data, including user information, title content, and media, is stored within databases on secure servers accessible only by the Lectora Online application. Authentication mechanisms are provided to ensure that data is kept secure from unauthorized access.

Only those people who have successfully logged in to Lectora Online will be able to access any data. Not even a search engine will find your data. The only way your title content can be made public is if you publish it to a public Website.

To maintain this security, we encourage all Lectora Online users to use strong passwords, to not share Lectora Online credentials with others, and to fully understand the sharing options in Lectora Online.
